

Amr Abujabal

Computer Science | Cloud & Backend | Computer Vision
(236) 338-2258 • Amrabujabal35@gmail.com • [LinkedIn](#) • [GitHub](#) • [Portfolio](#)

EDUCATION

University of British Columbia (Okanagan)

Expected May 2027

Bachelor of Science in Computer Science

TECHNICAL SKILLS

Languages: Python, Java, C, C++, SQL, R, JavaScript, HTML, CSS

Backend & Web: FastAPI, React, PostgreSQL, MySQL, REST APIs, JWT auth

Cloud & DevOps: Google Cloud Platform, Docker, Git, GitHub Actions, CI/CD, Linux/Unix

ML & Data: NumPy, pandas, scikit-learn, XGBoost, YOLOv10, SAM 2, TransReID/OSNet, vision-language models, multi-object tracking

Tools: Anaconda, Jupyter, RStudio

PROJECTS

PitchVision | *Computer Vision / ML · Cloud*

2026 – Present

- Building a single-camera player identification and performance analytics system for amateur and semi-pro soccer clubs, turning raw touchline footage into per-player metrics.
- Engineered a tracking and re-identification pipeline (YOLOv10 detection, SAM 2 segmentation, TransReID/OSNet re-ID) to maintain player identity across full-match clips.
- Produced coach-facing outputs: per-player movement stats (distance, speed zones), heatmaps, and team-level formation/possession views.

ByteBites – Food Delivery Backend | *COSC 310 Software Engineering*

2025

- Built a RESTful backend in FastAPI using a 3-layer architecture (API → Service → Repository) spanning 8 features: auth, menu management, ordering, delivery tracking, pricing, payment, and notifications.
- Implemented JWT authentication and role-based access control (USER / MANAGER / ADMIN).
- Set up Docker containerization and a CI pipeline; owned the auth and infrastructure workstream on a dedicated team branch.

Reproducing ResNet — Residual Learning on CIFAR | *Deep Learning · Paper Reproduction* 2026 – Present

- Reproducing the paper's CIFAR-10 results from He et al. (2015) using only the paper: 6n+2 layer construction, Option-A zero-pad identity shortcuts, per-pixel mean subtraction, and the SGD schedule (LR 0.1, ÷10 at 32k/48k, stop at 64k). Target: within ±0.5% of reported error over 3 seeds.
- Built the model, data pipeline, and training loop test-first (TDD): tests assert exact layer counts and parameter budgets (0.27M at ResNet-20, 0.85M at ResNet-56) before any training step.
- Extending into a controlled 2×2 ablation (original vs. pre-activation ResNet-56 × CIFAR-10 vs. CIFAR-100), schedule and compute fixed, ≥3 seeds per config, all results in one results.csv. Training on cloud GPU.

World Cup Match Outcome Predictor | *Personal Project*

2026

- Built a 3-class match outcome classifier (Win / Draw / Loss) using XGBoost and Random Forest with ELO-based engineered features.
- Developed a full-stack app with a FastAPI backend, PostgreSQL database, and React frontend, including user predictions and a live leaderboard.
